Senior Platform Engineer

Description

ShiftX mission is to make scheduling simple and create an outstanding employee experience. Our goal is to reimagine scheduling in the aviation industry and then apply that thinking to create a SaaS platform for multiple verticals.

Are you interested in **shifting** the conventional thinking in scheduling to create a disruptive platform that combines artificial intelligence capabilities with an innovative user-centric design?

1. We are looking for a product-focused engineer who cares about excellence in what they deliver.
2. We are a company where autonomy, creativity, thoughtfulness, trust are valued, and opportunities to grow are limited only by your imagination

Responsibilities

What you'll be doing:

- As a Principal Engineer, you will help us accelerate our pursuit of building a world-class niche SaaS platform targeted for multiple verticals.
- As an early and senior member of a growing team, you'll have significant ownership, input, and influence over the work that we do, and how we do it. You will develop a product that meets the needs of our rapidly growing user base. Primary responsibilities include driving the product architecture, bringing "design thinking" on product features, design and implementation of the key platform components, coordinating development efforts across the team, and working alongside designers to iterate on product UI/UX.
- This gig is not for the unseasoned. A coder and a leader, who has an appreciation for good design and usability. The technical problems we solve aren't simple. But this also means you'll be able to do work that matters and help a ton of people in a way you've never imagined.
- We're a small team with big ambitions which means we have a lot that we want to do. We need our new ideas to move to execution quickly so we can determine whether to invest more time in them or change course.
- If you've helped a fast-moving team win before and are ready to do it again, we want you on board.

Qualifications

- Experience with design and implementation of SaaS based flexible platforms
- Deep experience with J2EE/Web development skills.
- Experience in designing and implementing commercially viable large-scale platforms
- Experience with web technologies and architecture: responsive web, micro-services, distributed cloud services, distributed data, caching, RESTful APIs, etc.
- Ability to define crisp interfaces and thinking of performance and scalability
- Experience or strong interest in AI and Machine Learning
- Familiarity with relational and big data technologies such as Postgres, Hadoop, and NoSql Databases

Employment Type

Full time

Job Location

Chandler, AZ
